Use of Artificial Intelligence in GME Policy

Purpose and Scope:

The purpose of this policy is to establish guidelines for the responsible, ethical, and transparent use of Artificial Intelligence (AI) in Graduate Medical Education (GME) at the University of Kentucky (UK). This policy applies to residents, fellows, faculty, program leadership, program coordinators, and other individuals involved in GME-related educational, clinical, research, or administrative activities.

This policy governs the use of generative Artificial Intelligence (AI) tools that create text, images, code, or analytic outputs. It does not apply to limited-function tools such as spelling and grammar editing, reference managers, or routine clinical decision support systems already governed by existing clinical policies.

This policy is intended to complement, not replace, existing University of Kentucky clinical, information technology, privacy, security, research, and professionalism policies. All AI use must comply with applicable institutional policies, accreditation requirements, and federal and state laws.

Definitions:

Artificial Intelligence (AI): Computer systems designed to perform tasks that typically require human intelligence, including content generation, summarization, pattern recognition, and decision support.

Generative AI: AI systems capable of producing new content based on user prompts, such as large language models.

Human-in-the-Loop: A required process in which a qualified individual reviews, verifies,

and remains accountable for AI-assisted outputs.

Guiding Principles for AI Use in GME:

AI use in GME must adhere to the following principles:

- Human accountability: AI may support but must never replace professional judgment.
- Transparency: AI use must be disclosed when it meaningfully contributes to educational, research, clinical, or recruitment-related activities.
- Privacy and security: Protected Health Information (PHI), trainee educational records, and applicant data must be safeguarded in accordance with UK policies.
- Fairness: AI use should be monitored to ensure consistent and unbiased application and to mitigate unintended differences in outcomes.
- Proportionality: Higher-stakes decisions require greater oversight and caution.

All users remain accountable for outcomes resulting from AI-assisted work.

Education and Training:

Residents, fellows, and faculty may use AI tools to support learning, teaching preparation, curriculum development, and faculty development activities, provided that AI-generated content is reviewed and verified for accuracy and AI is not used to bypass required learning activities or assessments.

Individual GME programs are expected to develop program-level guidance regarding appropriate AI use within their educational and clinical training environments, reflecting the unique needs, risks, and workflows of their specialty and clinical settings.

Program Administration and Evaluation:

AI may be used to support drafting, organization, or synthesis of GME administrative and educational materials when appropriate safeguards are in place.

AI must not independently generate, determine, or finalize milestone assessments, promotion or graduation decisions, remediation plans, or disciplinary actions. All evaluative decisions require human review and accountability.

Clinical Care:

AI use in clinical settings within GME must comply with all University of Kentucky clinical,

privacy, and information technology policies. GME follows the [UKHC Guidelines and Recommendations for Generative AI in Clinical Care](#)

Residents and fellows may not enter Protected Health Information (PHI) into unapproved AI tools or use AI tools independently to generate clinical documentation, orders, or treatment decisions. AI may not replace clinical judgment or supervision.

Research and Scholarly Activity:

The use of AI in GME-related research and scholarly activity must be disclosed at all relevant stages of the research process and comply with IRB, sponsor, and scholarly publication requirements. AI tools do not replace authorship responsibility or scholarly accountability.

Recruitment and Selection:

AI may be used in a limited, supportive role for recruitment-related activities such as organizing application materials or drafting communications. Only UK Approved AI tools for recruitment (e.g. Thalamus Cortex) may be used for use in recruitment and selection. AI must not independently screen, score, rank, or select applicants. All recruitment decisions must be made by human reviewers.

Ethics, Equity, and Professionalism:

All AI use in GME must uphold ethical standards, professionalism, and respect for trainees, applicants, and patients. Inappropriate use may be addressed through existing institutional policies.

Approved Tools, Privacy, and Security:

Only University-approved AI tools that meet institutional privacy, security, and information technology standards may be used for activities involving trainee data, applicant information, clinical data, or research materials.

Users are encouraged to remain informed of University of Kentucky AI initiatives and guidance that are concurrently in development and will continue to evolve. Updates on University of Kentucky AI initiatives and guidance is updated in the [Commonwealth AI Transdisciplinary Strategy \(CATS AI\)](#) framework.
